

**INSTRUCTIONS**

**FOR APPLYING A TEST SECTION OF**

**ENVIROSEAL *EDC* DUST CONTROL**

1. Check the label on the drum for the application rate that fits your coverage needs.
2. Use a common watering can (usually 2.5 gallons).
3. Mark out an area that will require the amount of EDC you have placed into the watering can. (85-110 SF/Gallon)
4. Apply it on the soil and allow it to penetrate. Some clay based soils will require a longer absorption time than sandy soils.
5. On a permanent installation, you may need to remix EDC into the surface with a Box Blade or Grader to re-energize the EDC. Depending on final use, the application should last from six months to one year.
6. As always, Enviroseal can only improve our products with your input. Please contact our office with suggestions on application, longevity, or any comments. It is through your help we improve our products.
7. This product is totally environmentally safe and biodegradable.
